

CITS 5506: Internet of Things (Rubric for Project Proposal)

Task Nr	Task Detail	Marks	Exemplary (100%-80%)	Proficient (80%-60%)	Satisfactory (60%-30%)	Not Satisfactory (30%-0%)
1	What is the problem ? Why is solving important? What is the expected impact of the solution? (in dot points form).	15	Problem, its relevance and solution impact are clearly defined with well-articulated impact; concise and insightful.	Problem, relevance and impact are mostly clear; some minor clarity or detail missing.	Basic problem statement, relevance and impact partially addressed or not well reasoned.	Vague or unclear problem statement, lacks relevance and impact analysis.
2	How comprehensive is literature research , reporting the related work/products and identifying their strength and gaps .	15	Concise review with relevant comparisons and gaps identified of existing solutions/products. References are well integrated.	Good and concise review of related work/products with moderate insight of strengths and gaps. Minor omissions related to comparisons. References well integrated.	Average literature research and related work, lacks depth or contains few relevant comparisons. References not well integrated. Extensive and not very relevant use of AI tools.	Inadequate or missing literature review; lacks relevance or depth. Lack of understanding with irrelevant text taken from AI tools.
3	How will you do the project? Explain your design approach (sequence of steps).	15	Clear, logical methodology with detailed steps, relevance to envisage functionalities closely tied to the problem and solution.	Reasonable method and steps; mostly well-structured and logical to the project functionalities.	Basic methodology, lacks structure or omits some important steps. All functionalities not logically explained or linked to the design.	Approach and steps are hard to understand. Lack of logical thinking. Poorly articulated or incoherent methodology; lacks planning.
4	System Architecture (Block Diagram) Visual representation of subsystems and interactions.	10	Diagram is clear, complete, and shows subsystem interactions accurately.	Block diagram gives most subsystems, their relationship and interdependence. Few aspects are missing.	Block diagram gives some subsystems, their relationship and interdependence or the relationships are not fully correct. Diagram includes key parts but unclear or overly simplistic.	Diagram is unclear, incomplete, or inaccurate.
5	Explain design in terms of subsystems , their functionalities (software and Hardware) and their interdependence . Sub teams are made, and project divided into tasks for sub teams with sequential and defined timeline .	25	Subsystems, their functionalities, interdependence are fully and concisely explained. Tasks divided logically among sub-teams; realistic timeline provided.	Most Subsystems, their functionalities, interdependence explained. Task divisions clear; some room for improvement in clarity or planning.	Basic subsystem description with explanation of subsystems, their functionalities and interdependence. Task allocation or timeline needs work.	Poor subsystem definition; tasks and timeline are vague or missing.
6	Hardware Identified	10	All key hardware identified with justification, availability, cost, and delivery timeline.	Most hardware identified with sourcing information; minor details missing.	Hardware partially identified; little or no justification or sourcing data.	Little to no hardware specified; lacks relevance or realism.
7	References (IEEE Format)	10	All sources cited correctly in IEEE format; references are highly relevant and support the proposal.	Most citations in correct format; references mostly relevant and integrated.	Some citation errors; references partially relevant.	Many errors in citation; weak or irrelevant references.
